CONNECTICUT CHAPTER Diagnostic Centers

There is not a diagnostic test that can detect if a person has Alzheimer's disease; however, a thorough work-up should be performed to rule out other causes of dementia. An early diagnosis is important to maximize your time for planning for the future, to resolve uncertainty about health conditions, and to treat other causes of dementia. After a thorough assessment, a diagnosis of "probable" Alzheimer's disease can be made with 90 percent accuracy.

A diagnostic assessment involves several steps including a complete physical and neurological examination, a psychiatric assessment, laboratory tests, a complete medical history and a mental status evaluation. For more information, contact our office and ask for "Steps to Getting a Diagnosis: Finding Out if it's Alzheimer's disease."

Town	Diagnostic Center	Doctor/Notes	Phone
